(a)
share of awarded regions with a positive price
C (K = 2, unique top, near tie)
E (K = 2, crossing capacities)
D (K = 3, three agents)
F (K = 3, honest top agent)
dashed: where $\sigma_n < 1$
$\sigma_n = 1$
horizon, $\log_{10} n$
(b)
share of awarded regions at which the monitor convicts
crash, C
crash, E
crash, D
crash, F
dashed: ride the boundary at scale 1
proposed profile: 0 firings, all runs
$\sigma_n = 1$
horizon, $\log_{10} n$
(c)
shading and announced price
shading $\sigma_n = 3s_n + \rho_n$
mean announced price, C
mean announced price, E
mean announced price, D
mean announced price, F
$\sigma_n \geq 1$ forces a price of zero
horizon, $\log_{10} n$
(d)
platform revenue per round
dotted: the $M_{(2)}$ benchmark
revenue per round, C
revenue per round, E
revenue per round, D
revenue per round, F
horizon, $\log_{10} n$
(e)
per round, additive equilibrium
best of 6 deviations, C
best of 6 deviations, E
best of 6 deviations, D
best of 6 deviations, F
dotted: the part (A) budget / n
floor at 1e-05
horizon, $\log_{10} n$
(f)
error term / n
below the dotted line the guarantee says something
(A), C
(A), D
(B), C
(B), D
(C), C
(C), D
horizon, $\log_{10} n$
