(a)
per-round gain and bound
certified n = 8 000
certified n = 20 000
solid and dotted: the certified interval
dashed: the theorem's constant
x: a profile never finishes bidding
number of context profiles Q
(b)
per-round revenue and bidding share
second capacity $M_{(2)}$
revenue n = 8 000
revenue n = 20 000
dash-dot: share of the horizon spent bidding, $QKL_n/n$
number of context profiles Q
(c)
PL-MESP
windowed monitor
monitor, no slack
no price correction
no fallback (round robin)
runner-up, unmonitored
no monitor
statistics shared across profiles
-0.106
-0.106
-0.106
-0.106

-0.106
-0.053
n = 20 000 Q = 2
best tested deviation, per round
(d)
smallest horizon, $\log_{10} n$
price can be positive
bound (A) below n
slack (B) below n
slack (C) below n
public error below n
horizons that can be run
context dimension D = K d
